Example Pin Functions:

- Pin 1: Ignition switch input
- Pin 2-5: Injector outputs
- Pin 6-7: Coil control
- Pin 8: O2 sensor output
- Pin 9: Communication port (Serial or CAN)

Special Notes:

- Many aftermarket tuning solutions connect directly to the ECU pins for remapping.
- Pinouts are available publicly, but verify with the specific ECU revision.

Mitsubishi 16G & 20G ECU Pinouts (Evo VIII and IX)

These models feature more advanced ECUs with increased pins for additional sensors and controls.

Features:

- 144-pin or 160-pin connectors.
- Additional pins for features like active aero, advanced boost control, and launch control.

Key Pins:

- Injector and coil outputs are grouped in dedicated banks.
- Sensor inputs include wideband O2, exhaust temp, and boost pressure.
- Communication via CAN bus is standard in newer models.

Deciphering the Pin Functions

Understanding each pin's role is critical when wiring, troubleshooting, or modifying the ECU.

Common Pin Types:

- Power and Ground: Usually marked as +12V, +5V, GND, or B+.
- Sensor Inputs:

- TPS (Throttle Position Sensor): Typically a 5V reference with a signal and ground.
- MAP/MAF Sensors: Provide airflow data; require proper wiring to avoid false readings.
- Coolant Temp Sensor: Usually a thermistor providing resistance-based signals.
- Actuator Outputs:
- Fuel Injectors: Multiple wires, each controlling a specific injector.
- Ignition Coils: Usually controlled via transistor drivers.
- Boost Control Solenoids: Manage turbo boost pressure.
- Communication Lines:
- K-Line: Used for diagnostics on older models.
- CAN Bus: For modern vehicles, used for inter-module communication.
- Serial Data (UART): For tuning and data logging.

Important Tips:

- Always verify pin functions before wiring, referencing official manuals.
- Use multimeters and oscilloscopes for signal verification.
- Maintain proper grounding and shielding to prevent electrical noise.
