- Core or Collection Setup: Each collection represents a specific data domain, such as books, articles, or authors.
- Indexing Pipeline: Content from Manning?s CMS flows into Solr via custom ingestion scripts or APIs, transforming raw data into indexable documents.
- Faceted and Filtered Search Layer: Users? search queries are processed through Solr?s powerful query engine, which returns sorted, filtered results complete with facets.
- Load Balancers: Distribute incoming search requests evenly across nodes.
- Replication and Sharding: Distribute data across nodes to ensure fault tolerance and performance.

Content Indexing Workflow

- Content Extraction: Metadata, full text, tags, and other relevant information are extracted from Manning's publishing database.
- Data Transformation: Content is converted into a JSON or XML format compatible with Solr schemas.
- Indexing: Data is pushed into Solr cores via REST API calls, often through scheduled jobs or real-time indexing services.
- Reindexing & Updates: When content is updated or new publications are added, the index is refreshed dynamically to reflect changes instantly.

Query Processing and Search Features

- Standard Search: Users input keywords, with Solr returning the most relevant results based on TF-IDF and BM25 ranking algorithms.
- Faceted Navigation: Filters like publication year, author, genre, or keywords help users narrow results.
- Autocomplete & Suggestions: As users type, Solr provides real-time suggestions, improving usability.
- Advanced Search: Boolean operators, phrase searches, proximity, and fuzzy matching enable precise queries.
- Sorting and Relevance Tuning: Results can be sorted by relevance, date, or custom metrics.
