Sample Problems and Solutions from Reif's Text

To illustrate the problem-solving methodology, consider some typical problems and the strategies used in Reif's solutions.

Example 1: Deriving the Maxwell-Boltzmann Distribution

Problem: Derive the Maxwell-Boltzmann distribution for the velocities of particles in an ideal gas.

Solution Outline:

- Start with the assumptions of classical particles, distinguishable and non-interacting.
- Write the probability of a particle having velocity $\mathbf{v}$ proportional to the Boltzmann factor $\exp\left(-\frac{1}{2} m \mathbf{v}^2 / k_B T\right)$.
- Normalize the distribution by integrating over all velocities.
- Arrive at the expression:

$$f(\mathbf{v}) = \left(\frac{m}{2\pi k_B T} \right)^{3/2} \exp\left(-\frac{m \mathbf{v}^2}{2 k_B T}\right)$$

]

Physical insight: The distribution shows that higher velocities are less probable, with the most probable speed depending on temperature.

Example 2: Calculating the Partition Function for a Quantum Harmonic Oscillator

Problem: Find the partition function Z for a quantum harmonic oscillator at temperature T .

Solution Outline:

- Use the energy levels $E_n = \hbar \omega (n + 1/2)$.
- Write the partition function:

[

$$Z = \sum_{n=0}^{\infty} e^{-\beta E_n} = e^{-\beta \hbar \omega / 2} \sum_{n=0}^{\infty} e^{-\beta \hbar \omega n}$$

]

- Recognize the geometric series and sum:

[

$$Z = \frac{e^{-\beta \hbar \omega / 2}}{1 - e^{-\beta \hbar \omega}}$$

]

Physical insight: The partition function encapsulates the statistical weight of all energy levels, enabling computation of thermodynamic quantities like internal energy and specific heat.

Question What are the key differences between the canonical and grand canonical ensembles in statistical mechanics 2e? The canonical ensemble describes a system with fixed number of particles, volume, and temperature, where the system exchanges energy with a heat bath. The grand canonical ensemble, on the other hand, allows for fluctuations in particle number, fixing temperature, volume, and chemical potential, making it suitable for open systems. The main difference lies in whether particle number is conserved (canonical) or allowed to fluctuate (grand canonical). How does the concept of entropy relate to the microstates in statistical mechanics 2e? In statistical mechanics 2e, entropy quantifies the degree of disorder or the number of microscopic configurations (microstates) corresponding to a given macrostate. It is defined by Boltzmann's relation $S = k_B \ln(\Omega)$, where Ω is the number of microstates. Higher entropy indicates a greater number of possible microstates, reflecting increased disorder. What role does the partition function play in calculating thermodynamic properties in statistical mechanics 2e? The partition function is a central quantity in statistical mechanics 2e, serving as a sum over all possible microstates weighted by their Boltzmann factors. It encodes the statistical weights of states and allows for the derivation of thermodynamic properties such as free energy, average energy, entropy, and specific heat. Once the partition function is known, many thermodynamic quantities can be computed systematically. How is the concept of equipartition of energy discussed in statistical mechanics 2e? Equipartition of energy states that, at thermal equilibrium, each quadratic degree of freedom contributes equally to the average energy, typically $(1/2)k_B T$ per degree of freedom. In statistical mechanics 2e, this principle helps explain the distribution of energy among particles and modes, especially in classical systems, and provides insights into heat capacities and energy distribution. What are the conditions under which the thermodynamic limit applies in statistical mechanics 2e? The thermodynamic limit involves taking the number of particles N and volume V to infinity while keeping the density N/V constant. This limit ensures that surface effects become negligible and that macroscopic properties become well-defined and smooth functions of variables. It is essential for deriving thermodynamic behavior from microscopic models and for the validity of statistical ensembles.
