- The probability of any event is non-negative.
- The probability of the entire sample space is 1.
- For mutually exclusive events, the probability of their union is the sum of their probabilities.

Statistics and Data Analysis

Statistics involves collecting, analyzing, interpreting, and presenting data. It helps in making informed decisions based on data patterns. Its main branches include:

- Descriptive Statistics: Summarizes data using measures like mean, median, mode, variance, and standard deviation.
- Inferential Statistics: Draws conclusions about a population based on a sample, involving hypothesis testing, confidence intervals, and regression analysis.

Random Processes

A random process (or stochastic process) is a collection of random variables indexed by time or space. It models systems that evolve randomly over time, such as stock prices, communication signals, or noise in electronic circuits.

Types of Random Processes:

- Discrete-time processes: Defined at specific time intervals.

Fundamental Concepts in Probability and Statistics

Random Variables and Probability Distributions

A random variable assigns a numerical value to each outcome in the sample space. They are characterized by probability distributions:

- Discrete Random Variables: Have countable outcomes, e.g., number of arrivals.
- Continuous Random Variables: Have uncountably infinite outcomes, e.g., measurement errors.

Important distributions:

- Discrete: Binomial, Poisson, Geometric.
- Continuous: Normal, Exponential, Uniform.

Joint, Marginal, and Conditional Distributions

- Joint Distribution: Probability distribution of two or more random variables.
- Marginal Distribution: Distribution of a subset of variables, derived from joint distributions.
- Conditional Distribution: Distribution of one variable given the value of another.

Expectation and Variance

- Expected Value (Mean): The average or central value of a random variable.
- Variance: Measures the spread or dispersion around the mean.

Mathematically:

- $E[X] = \sum x_i P(x_i)$ for discrete variables.
- $Var(X) = E[(X - E[X])^2]$.

Analysis of Random Processes

Autocorrelation and Power Spectral Density

- Autocorrelation Function: Measures the similarity between a process and a time-shifted version of itself.
- Power Spectral Density (PSD): Shows how power of a signal or process is distributed over frequency.

Stationarity and Ergodicity
