Step-by-step Solution:

- The radius of a typical disk at (x) is $(y = \sqrt{x})$.
- The area of the cross-section at (x) is:

$$\pi [\text{radius}]^2 = \pi (\sqrt{x})^2 = \pi x$$

- Set up the integral:

$$V = \int_0^4 \pi x \, dx$$

- Compute the integral:

$$V = \pi \left[\frac{x^2}{2} \right]_0^4 = \pi \left(\frac{16}{2} - 0 \right) = \pi \times 8 = 8\pi$$

After 10 minutes, 1020 liters of water have been added.

Advanced Applications and Multi-step Problems

Real-world problems often involve multiple variables, changing conditions, or layered calculations. Here, integral calculus techniques such as substitution, integration by parts, and setting up composite integrals are essential.

Example: Work Done in Lifting an Object with Varying Weight

Problem:

A vertical cable of length 20 meters and linear weight density $w(x) = 2x$ kg/m (where x is the distance from the top) needs to be lifted to the top. Calculate the work required to lift the entire cable, assuming gravity $g = 9.8$ m/s².

Solution Approach:

- The work to lift a small segment dx at position x is:

\\

$$dW = (\text{weight of segment}) \times (\text{distance lifted})$$

\\

- The weight of the segment:

\\

$$dW_{\text{mass}} = w(x) dx$$

\\

- Since lifting from position (x) to the top (at $(x=0)$), the distance lifted is (x) .

Step-by-step Solution:

- Convert weight density to force:

[

$$dF = w(x) g \, dx = 2x \times 9.8 \, dx$$

]

- Total work:

[

$$W = \int_0^{20} \text{force} \times \text{distance} = \int_0^{20} (2x \times 9.8) \times x \, dx$$

]

- Simplify integrand:

[

$$19.6 x^2$$

]

- Compute the integral:

[

$$W = 19.6 \int_0^{20} x^2 \, dx = 19.6 \left[\frac{x^3}{3} \right]_0^{20} = 19.6 \times \frac{8000}{3} = \frac{19.6 \times 8000}{3}$$

]

- Final calculation:

\[

$$W = \frac{156,800}{3} \approx 52,266.67 \text{ Joules}$$

\]

Interpretation:

Approximately 52,267 Joules of work are needed to lift the entire cable.

Gorakh prasad differential calculus

Gorakh Prasad Differential Calculus is a foundational topic in mathematics that plays a crucial role in understanding how quantities change and how to analyze the behavior of functions. Named after the renowned mathematician Gorakh Prasad, this branch of calculus focuses on the study of derivatives, rates of change, and the slopes of curves. Whether you are a student preparing for competitive exams, a teacher designing curriculum, or a calculus enthusiast looking to deepen your understanding, exploring Gorakh Prasad Differential Calculus offers valuable insights into the core principles of mathematical analysis.

Introduction to Differential Calculus

Understanding the Basics

Differential calculus primarily concerns itself with the concept of the derivative, which measures the instantaneous rate of change of a function concerning its variable. The derivative provides critical information about the function's behavior, such as increasing or decreasing trends, concavity, and points of inflection.

Historical Background

The development of differential calculus is attributed to mathematicians Isaac Newton and Gottfried Wilhelm Leibniz in the late 17th century. Their groundbreaking work laid the foundation for modern calculus, enabling scientists and engineers to model real-world phenomena involving change.

Core Concepts of Gorakh Prasad Differential Calculus

Definition of Derivative

The derivative of a function $f(x)$ at a point $x=a$ is defined as the limit:

$$f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$$

This limit, if it exists, represents the slope of the tangent line to the graph of $f(x)$ at $x=a$.

Geometric Interpretation

The derivative at a point corresponds to the slope of the tangent line to the curve at that point. This

interpretation helps visualize how the function is behaving locally.

Physical Significance

In physics, derivatives represent rates such as velocity (change of displacement with time) and acceleration (change of velocity with time).

Rules of Differentiation

Basic Differentiation Rules

Understanding fundamental rules simplifies the process of finding derivatives.

- **Power Rule:** $\frac{d}{dx} x^n = n x^{n-1}$
- **Constant Rule:** $\frac{d}{dx} c = 0$, where (c) is constant
- **Constant Multiple Rule:** $\frac{d}{dx} [c \cdot f(x)] = c \cdot f'(x)$
- **Sum Rule:** $\frac{d}{dx} [f(x) + g(x)] = f'(x) + g'(x)$
- **Difference Rule:** $\frac{d}{dx} [f(x) - g(x)] = f'(x) - g'(x)$

Product and Quotient Rules

These are essential for differentiating products and ratios of functions.

- **Product Rule:** $\frac{d}{dx} [f(x) \cdot g(x)] = f'(x) g(x) + f(x) g'(x)$
- **Quotient Rule:** $\frac{d}{dx} \left[\frac{f(x)}{g(x)} \right] = \frac{f'(x) g(x) - f(x) g'(x)}{[g(x)]^2}$

Chain Rule

Crucial for differentiating composite functions, the chain rule states:

$$\frac{d}{dx} f(g(x)) = f'(g(x)) \cdot g'(x)$$

Applications of Gorakh Prasad Differential Calculus

Finding Tangents and Normals

Given a curve $(y = f(x))$, the derivative at a point provides the slope of the tangent line. The tangent

line equation at $(x=a)$ is:

$$[y - f(a) = f'(a) (x - a)]$$

The normal line, perpendicular to the tangent, has a slope $(-1/f'(a))$.

Determining Local Maxima and Minima

Critical points occur where $(f'(x) = 0)$ or $(f'(x))$ is undefined. The second derivative test helps classify these points:

- If $(f''(x) > 0)$, the point is a local minimum.
- If $(f''(x)$

Analyzing Concavity and Points of Inflection

The second derivative indicates the concavity of the function:

- If $(f''(x) > 0)$, the graph is concave upward.
- If $(f''(x)$

Points where the concavity changes are points of inflection.

Optimization Problems

Differential calculus helps solve real-world optimization problems, such as maximizing profit or minimizing cost, by analyzing the derivatives of relevant functions.

Advanced Topics in Gorakh Prasad Differential Calculus

Mean Value Theorem

States that for a function continuous on $([a, b])$ and differentiable on $((a, b))$, there exists some $(c \in (a, b))$ such that:

$$[f'(c) = \frac{f(b) - f(a)}{b - a}]$$

This theorem underpins many other results in calculus.

L'Hôpital's Rule

A technique for evaluating indeterminate forms like $\frac{0}{0}$ or $\frac{\infty}{\infty}$:

- If $\lim_{x \rightarrow a} f(x) = 0$ and $\lim_{x \rightarrow a} g(x) = 0$, then:

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}$$

provided the latter limit exists.
